Red Hot Poker

Desert Willow

Bird of Paradise

Gayfeather

Fragrant Mist Flower

Sage, Mealy Blue

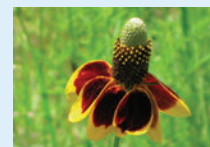

Texas Lantana

Texas Sage

Texas Betony

Mexican Hat

Phlox, Fragrant

Planting with pollinators in mind not only provides value to your landscape, but also promotes blooming growth for your flowers! As you provide food for these butterflies, bees and hummingbirds, you benefit from the cross pollination that takes place as they transfer pollen from one flower to another. This will allow your flowers to bloom better. Keep in mind that when you contribute to planting with pollinators in mind you are helping each pollinator in the problems they are currently facing. Bees are fighting colony collapse disorder, a trend of honey bees disappearing across North America. Butterflies are dealing with the destruction of their natural habitat. With the increase of invasive plants, hummingbirds are no longer recognizing their native plants that they normally feed off.

Keep these above plants in mind when looking for a flower to plant in your garden!
